

Cross-References

This document demonstrates mdforge's cross-reference syntax. See [Syntax](#) for usage details.

Syntax

Two directives are available:

Directive	Purpose
<code>@see(Name)</code>	Link to a heading or anchor
<code>@anchor(Name)</code>	Create an invisible link target

Linking to Headings

Any heading automatically gets an ID based on its text. Use `@see` to link to it:

```
See [Syntax](#syntax) for details.
```

The name must match the heading text exactly.

Custom Anchors

Sometimes you need to link to a specific paragraph that isn't a heading. Place `@anchor(Name)` on its own line, then reference it with `@see(Name)`.

This paragraph has an anchor above it. Link to it with [Custom Anchors](#).

How It Works

The `@see` directive transforms into a markdown link:

- `@see(Syntax)` becomes `[Syntax](#syntax)`

Slugs are generated like heading IDs: lowercase, spaces to hyphens, special characters removed, unicode/diacritics transliterated to ASCII.

Summary

- [Syntax](#) - the two directives
- [Custom Anchors](#) - linking to non-headings
- [How It Works](#) - the transformation
